Abstract— Suicidal thoughts and attempts are a growing concern among university students. This paper addresses the pressing issue of suicidal tendencies among university students and proposes a technological solution to prevent such occurrences. This study investigates the development of a comprehensive website platform tailored to provide mental health support specifically for university students. The implementation of such a technological solution requires careful consideration of privacy, ethics, and accessibility concerns. Therefore, this paper discusses the ethical implications of using technology in mental health support systems and proposes strategies to ensure user confidentiality and data security. Furthermore, the effectiveness of the proposed solution will be evaluated through further studies and user feedback. By using the power of technology, this initiative aims to create a supportive environment for university students, ultimately reducing the prevalence of suicidal tendencies and promoting overall well-being.

Index Terms— Suicidal tendencies, University students, Mental health support, Technological solution, Website development

I. INTRODUCTION

A. Background Information

The issue of mental health among university students has garnered increasing attention in recent years. With a rapidly growing youth population and rising academic pressures, universities across the country are witnessing a concerning trend of mental health challenges, including suicidal tendencies among students. The competitive nature of the education system, coupled with high expectations from families and society, places immense pressure on university students to excel academically. Additionally, factors such as financial constraints, social isolation, and cultural stigmatization of mental health issues further exacerbate the vulnerability of students to mental health problems. A study reveals that at least 101 university students committed suicide in 2021, with 64.36% being male students.[1]

B. Overview

This research aims to address the pressing issue of suicidal tendencies among university students in Bangladesh by proposing a technological solution tailored to the local context. Drawing upon the unique socio-cultural factors and challenges

faced by students in Bangladesh, the proposed solution seeks to provide accessible and personalized mental health support through a comprehensive website platform. The report focuses on the importance of introducing new technology to address the mental health challenges faced by university students and to provide them with effective support systems.

II. METHODS

A. Description of the solution

A valuable tool for promoting mental well-being among university students in Bangladesh can be served by a website platform. This can be achieved by offering a combination of functionalities containing self-assessment tools for depression and anxiety, educational resources on mental health awareness and suicide prevention, crisis support options with hotlines, anonymous chat functionality with trained professionals, and peer-to-peer connections with a sense of community and belonging for students facing similar challenges. By empowering students to take charge of their mental health and prevent potential tragedies, the website can make a significant impact.

B. Method Used

A questionnaire-based survey was conducted among 30 university students in Bangladesh to understand their mental health challenges, preferred coping mechanisms, and technology usage patterns. Google Form was used to prepare and distribute the questions. Responses were collected from April 16 to April 21 of the year 2024. Existing research papers on student mental health, suicide prevention strategies, and the effectiveness of website interventions were analyzed.

C. Rationale of selection participants

Students were chosen for the survey because mental health problems like feeling sad or thinking about harming themselves are often experienced by them. They often encounter a lot of challenges, including school stress and other factors. Their experiences are being understood to help them better.

III. RESULTS AND DISCUSSION

A. Results

It could be observed from figure 1 that more than half of the students reported experiencing feelings of isolation or loneliness during their time at university.

Have you ever felt isolated or lonely during your time at university?

B. Discussion

From the data in the results section, it can be said that the solution to the problem of suicidal tendencies among university students can be minimize if a community base website can provide mental health support. One of the major findings is that 30 percent frequently and 46.7 percent of students occasionally feel isolated during university times. On the other hand, 23.3 percent of students had thought about suicide. Almost 77 percent of the students thought having a supportive community could positively impact mental health among university students.

As most of the respondents agreed on implementation of a community base website, where students can anonymously share their thoughts, feelings and can took mental support by each other or resources.

IV. CONCLUSION

In conclusion, our research highlights the urgent need for effective mental health support systems for university students in Bangladesh. The findings indicate that a significant proportion of students experience feelings of isolation, sadness, and thoughts of suicide, underscoring the severity of the issue. However, there is hope in the form of technological interventions, such as community-based websites, which have been shown to positively impact mental health outcomes among students. By leveraging such solutions, we can create a supportive environment where students feel comfortable seeking help and connecting with peers, ultimately reducing the prevalence of suicidal tendencies and promoting overall well-being.
